

Quadrant RASWIN Release Note – 6/9/2014 – Version 1.0.4254 or later

A minor change to the way program version checking has been implemented.

In older versions you had the option to tell the program to check for program updates via the WEB (by looking on the Quadrant web site for a more current program version), via your Local Network (by comparing the program version on your workstation to the most current version on any other workstation via the database), or to simply SKIP these tests completely.

We have now made it possible to check both the WEB and your local network via two new settings which replace the older setting.

These are shown below (for register 001). There will be settings established automatically as shown for EACH register the first time they run the newer version of the RASWIN.EXE program.

MISC_PARM	TEXT_VALUE
001-CHECK-VERSION-LOCAL	Y
001-CHECK-VERSION-WEB	Y

If the setting is Y (the default) the program will try to check the RASWINSQL database or the Quadrant website to find a more current version. If set to N it will skip that particular test. The old setting “xxx-VERSION-CHECK-MODE” will automatically be deleted. If both settings are N these tests will be skipped. It will never automatically download or update anything on your workstation.

If a newer version is detected in either location a display similar to this one will be shown:
