

Quadrant RASWIN Release Note – 8/13/2014 – Version 1.0.4309 or later

1. A change to the way certain SQL scripts related to updating the database has been made. In prior versions, RASWIN would check a table in the database to see what scripts to run and then conditionally run the scripts if it appeared they had not been run once. Depending on timing and other factors it was possible that these scripts could be processed multiple times, which was not the intent. We have thus changed the logic so that after one of these scripts is processed the file name is modified by adding a suffix of “_DONE” to the end of the file name. Thus, if the program tries to run the script again, it won’t waste the time doing it because it won’t find the file it is trying to run. If you run the full setup again in the future, the sql scripts will be ‘refreshed’ so they can be run again to insure that all required changes are made.

Some of the scripts perform a fair amount of updating so the program startup can take a little while to complete. Subsequent startups will be faster.
