

9/29/2014 – Version 1.0.4408 or later

Eureka! After months of trying to find a fix for the issue of the ENTER key not working on some command buttons it has finally been determined why this was happening and making a fix for it. This was especially a problem on the line item entry screen, but we think it is finally resolved. If you find places where it is not fixed, please let us know.

New Feature in RASWIN – 9/26/214 – Version 1.0.4405 or later

This feature allows you to create a report which provides very detailed information about how you have set up your payment type lists. Payment type lists have been a feature of the Quadrant RASWIN for quite some time and allow you to create a shortcut list of payment methods that are permitted for each transaction type. Each payment method in the payment types table has a one digit payment type code, which can be any letter (A-Z) or number (0-9). Each payment type should have a unique payment type code.

The payment type list consists of a string of these one character payment type codes, and is placed in the payment type list field in the trancodes table. For example, suppose you have a particular tranocode and you only want to allow cash and checks to be taken for that transaction code. Here's how your payment types table might be created

Method	Description	Payment_type_code
-----	-----	-----
Cash	CASH	A
CK	CHECK	K
CC	Credit Card	C
DD	Direct Deposit	D

The above are examples only and do not show the full contents of the payment types table. Suppose you wanted to create a group that permitted cash and check only.

First you would create a payment types set entry in the payment types sets table (which is a subset of the miscellaneous parameters table)

PAYMENT-TYPE-SET#:001 AK

if you had another combination of payments that you wish to accept for certain drink once , say cash check and credit card you could create a second payment type set as shown below:

PAYMENT-TYPE-SET#:002 AKC

and if you had a third combination of payment types you wish to accept, say all the ones above, you can do this by creating a third payment type set such as this one:

PAYMENT-TYPE-SET#:003 AKCD

another way to define all payment methods as being permitted is to use the *
character as your payment typeset value e.g.:

PAYMENT-TYPE-SET#:003 *

Lastly on the particular transaction codes in question (those which can accept the particular list of payment types defined in your payment type sets) he would place the payment typeset number, e.g.:

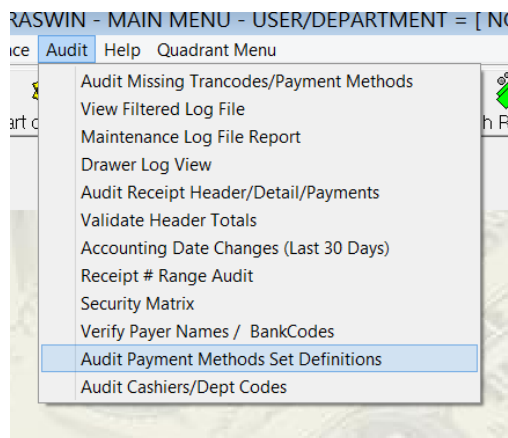

TRAN_CODE	TRAN_DESCRIPTION	PMT_TYPES_LIST
0002	FEDERAL WITHHOLDING TAXES	002
0003	MEDICARE (1.45% OF SALARY)	003
0004	PROPERTY TAX	001
0005	DEFERRED REVENUE	001

Note that we have adjusted the column display for the trend codes table so that only these three columns are shown but you will have to scroll to the right to see the payment types list settings.

You can also put an asterisk “*” in the payment type list in the transaction codes table instead of a defined payment types list, which tells the program to allow all payment methods free of any restrictions for that particular transaction code.

The payment type sets names do not have to be numeric values as shown in the example above, such as 001, 002, 003 and so on. They can be descriptive values such as a department name, e.g.FIN, or PARKS, or ENGINEERING.

This feature has been in the Quadrant RASWIN program for quite some time. The new feature that has been added is a report which allows you to audit your current settings to make it easier to find any that are not in line with what you want them to be. This report will appear on the audit menu as shown below.

When you select this option a simple screen will appear and all you need to do is click on the Create Report button to have the program generate the needed output. In just a few seconds a report will appear in your web browser, from which you can view or print the report.
